

Context Free Grammar Exercises:

Exercise 1:

Consider the CFG G with non-terminals $\{E, T\}$, terminals $\{a, b, c, d, e\}$, start symbol E and productions:

$E \rightarrow Eabc$

$E \rightarrow Ecde$

$E \rightarrow T$

$T \rightarrow bc$

Transform G into an equivalent CFG G' without left recursion.

Solution:

Remember the rule we have seen in class:

$\langle \text{foo} \rangle \rightarrow \langle \text{foo} \rangle \alpha_1$	Becomes:	$\langle \text{foo} \rangle \rightarrow \beta_1 \langle \text{bar} \rangle$
$\langle \text{foo} \rangle \rightarrow \langle \text{foo} \rangle \alpha_2$		$\langle \text{foo} \rangle \rightarrow \beta_1 \langle \text{bar} \rangle$
...		...
$\langle \text{foo} \rangle \rightarrow \langle \text{foo} \rangle \alpha_n$		$\langle \text{foo} \rangle \rightarrow \beta_n \langle \text{bar} \rangle$
$\langle \text{foo} \rangle \rightarrow \beta_1$		
$\langle \text{foo} \rangle \rightarrow \beta_2$		$\langle \text{bar} \rangle \rightarrow \alpha_1 \langle \text{bar} \rangle$
...		$\langle \text{bar} \rangle \rightarrow \alpha_2 \langle \text{bar} \rangle$
$\langle \text{foo} \rangle \rightarrow \beta_n$...
		$\langle \text{bar} \rangle \rightarrow \alpha_n \langle \text{bar} \rangle$
		$\langle \text{bar} \rangle \rightarrow \epsilon$

In the case of our grammar, we map E to foo , abc to α_1 , cde to α_2 , and T to β_1 . Therefore, we obtain G' as:

$E \rightarrow TE'$

$E' \rightarrow abcE'$

$E' \rightarrow cdeE'$

$E' \rightarrow \epsilon$

$T \rightarrow bc$

Note that E' is a new non-terminal we introduced to eliminate left-recursion.

Exercise 2:

Consider the CFG G with non-terminals {S,A }, terminals {a,b}, start symbol S and productions:

$S \rightarrow Aa$

$S \rightarrow b$

$A \rightarrow Aab$

$A \rightarrow \epsilon$

Is the grammar left-recursive? If yes, eliminate the left recursion.

Solution:

Yes, the grammar is left-recursive with productions $A \rightarrow Ab \mid \epsilon$

Based on the rule we have seen in class, we map A to α_1 , ab to α_1 , and ϵ to β_1 . Therefore:

$S \rightarrow Aa$

$S \rightarrow b$

$A \rightarrow A'$

$A' \rightarrow abA'$

$A' \rightarrow \epsilon$

Note that A' is a new non-terminal we introduced to eliminate left-recursion.

Exercise 3:

Consider the CFG G with non-terminals $\{S, A\}$, terminals $\{a, b, c, d\}$, start symbol S and productions:

$S \rightarrow Aa$

$S \rightarrow b$

$A \rightarrow Sd$

$A \rightarrow \epsilon$

Is the grammar left-recursive? If yes, eliminate the left recursion.

Solution:

Yes, the grammar is left-recursive since it can be re-written as follows:

$S \rightarrow Aa$

$S \rightarrow b$

$A \rightarrow Aa$

$A \rightarrow bd$

$A \rightarrow \epsilon$

I have just replaced S by its value in $A \rightarrow Sd$. This shows that the grammar is clearly left-recursive with $A \rightarrow Aa|bd|\epsilon$.

Based on the rule we have seen in class, we map A to foo , ad to α_1 , bd to β_1 , and ϵ to β_2 . Therefore:

$S \rightarrow Aa$

$S \rightarrow b$

$A \rightarrow A'$

$A \rightarrow bdA'$

$A' \rightarrow adA'$

$A' \rightarrow \epsilon$

Note that A' is a new non-terminal we introduced to eliminate left-recursion.

Exercise 4:

Consider the CFG G with non-terminal $\{S, T\}$, terminals $\{a, b, c, d, e\}$, start symbol S and productions:

$S \rightarrow abcd$

$| abc$

$| ab$

$| Tabc$

$T \rightarrow e$

Perform left factoring on G .

Solution:

Let's review the rule we have seen in class:

For each non-terminal A , find the longest prefix α common to two or more of its alternatives

If $\alpha \neq \epsilon$, then replace all of the A productions

$A \rightarrow \alpha\beta_1 \mid \alpha\beta_2 \mid \alpha\beta_3 \mid \dots \mid \alpha\beta_n$

With

$A \rightarrow \alpha A'$

$A' \rightarrow \beta_1 \mid \beta_2 \mid \beta_3 \mid \dots \mid \beta_n$

Hence, for $S \rightarrow abcd \mid abc \mid ab$, the longest common prefix is **ab** . If we apply the transformation described in the rule above, we obtain:

$S \rightarrow abS'$

$| Tabc$

$S' \rightarrow cd$

$| c$

$| \epsilon$

$T \rightarrow e$

Furthermore, we notice that we can still perform left factoring on $S' \rightarrow cd \mid c$ since **c** is a common prefix.

Therefore, we obtain:

$S \rightarrow abS'$

$| Tabc$

$S' \rightarrow cS''$

$| \epsilon$

$S'' \rightarrow d$

$| \epsilon$

$T \rightarrow e$

Note that S' and S'' are new non-terminals we introduced to perform left factoring.

Exercise 5:

Consider the CFG G with non-terminal $\{S, E\}$, terminals $\{\text{if}, \text{then}, \text{else}, a, b\}$, start symbol S and productions:

$S \rightarrow \text{if } E \text{ then } S$
 $| \text{if } E \text{ then } S \text{ else } S$
 $| a$
 $E \rightarrow b$

Perform left factoring on G .

Solution:

$S \rightarrow \text{if } E \text{ then } SS'$
 $| a$
 $S' \rightarrow \text{else } S$
 $| \epsilon$
 $E \rightarrow b$

Exercise 6:

Given the grammar:

$\langle S \rangle ::= \langle X \rangle \langle Y \rangle$

$\langle X \rangle ::= h \mid \epsilon$

$\langle Y \rangle ::= p$

Where $\langle S \rangle$, $\langle X \rangle$, and $\langle Y \rangle$ are the non-terminal symbols.

Find the FIRST sets for all non-terminals.

Solution:

We refer to the rules covered in class:

- 1) $\text{FIRST}(\text{terminal}) = \{\text{terminal}\}$
- 2) If $A \rightarrow a\alpha$, and a is a terminal:
 $\{a\} \in \text{FIRST}(A)$
- 3) If $A \rightarrow B\alpha$, and rule $B \rightarrow \epsilon$ does **NOT** exist:
 $\text{FIRST}(B) \in \text{FIRST}(A)$
- 4) If $A \rightarrow B\alpha$, and rule $B \rightarrow \epsilon$ **DOES** exist:
 $\{(\text{FIRST}(B) - \epsilon) \cup \text{FIRST}(\alpha)\} \in \text{FIRST}(A)$

$\text{FIRST}(X) = \{h, \epsilon\}$ (2nd rule)

$\text{FIRST}(Y) = \{p\}$ (2nd rule)

$\text{FIRST}(S) = [\text{FIRST}(X) - \epsilon] \cup \text{FIRST}(Y) = \{h, p\}$ (4th rule)

Exercise 7:

Given the grammar:

$\langle S \rangle ::= \langle X \rangle \langle Y \rangle$

$\langle X \rangle ::= h$

$\langle Y \rangle ::= p \mid \epsilon$

Where $\langle S \rangle$, $\langle X \rangle$, and $\langle Y \rangle$ are the non-terminal symbols.

Find the FOLLOW sets for all non-terminals.

Solution:

We refer to the rules covered in class:

- 1) $\{\$ \} \in \text{FOLLOW}(S)$
- 2) If $A \rightarrow \alpha B$:
 $\text{FOLLOW}(A) \in \text{FOLLOW}(B)$
- 3) If $A \rightarrow \alpha B \gamma$, and $\gamma \rightarrow \epsilon$ does **NOT** exist:
 $\text{FIRST}(\gamma) \in \text{FOLLOW}(B)$
- 4) If $A \rightarrow \alpha B \gamma$, and $\gamma \rightarrow \epsilon$ **DOES** exist:
 $\{(\text{FIRST}(\gamma) - \epsilon) \cup \text{FOLLOW}(A)\} \in \text{FOLLOW}(B)$

$\text{FOLLOW}(S) = \{\$ \}$ (1st rule)

$\text{FOLLOW}(X) = [\text{FIRST}(Y) - \epsilon] \cup \text{FOLLOW}(S)$

$= \{p, \$ \}$ (4th rule)

$\text{FOLLOW}(Y) = \text{FOLLOW}(S)$

$= \{\$ \}$ (2nd rule)

Exercise 8:

Given the grammar:

$\langle S \rangle ::= \langle X \rangle \langle Y \rangle h$

$\langle X \rangle ::= h \mid \epsilon$

$\langle Y \rangle ::= p \mid \epsilon$

Where $\langle S \rangle$, $\langle X \rangle$, and $\langle Y \rangle$ are the non-terminal symbols.

Find the FIRST and FOLLOW sets for all non-terminals.

Solution:

For the FIRST sets calculations:

$\text{FIRST}(X) = \{h, \epsilon\}$ (2nd rule ... or just common sense!)

$\text{FIRST}(Y) = \{p, \epsilon\}$ (2nd rule as well...)

Now, the $\text{FIRST}(S)$ is the only challenging one.

I know that the 2nd rule will not apply since $\langle S \rangle$ derives a string that does not start with a terminal.

How about the 3rd rule? I will try to apply it by mapping the symbols of the 3rd rules onto the symbols of the only production where $\langle S \rangle$ appears on the left-hand side (remember, when you are finding the FIRST for a terminal, you only look at the productions where that terminal appears on the left-hand side).

$$\begin{array}{ccccc} A & & B & & \alpha \\ \uparrow & & \uparrow & & \uparrow \\ \langle S \rangle & ::= & \langle X \rangle & \langle Y \rangle & h \end{array}$$

The mapping works great. However, the 3rd rule specifically says that $B \rightarrow \epsilon$ should **NOT** exist. However, I do have a production $X \rightarrow \epsilon$. Therefore, I cannot apply the 3rd rule. So, let's analyze the 4th rule (which has the same mapping as the 3rd rule):

$$\begin{array}{ccccc} A & & B & & \alpha \\ \uparrow & & \uparrow & & \uparrow \\ \langle S \rangle & ::= & \langle X \rangle & \langle Y \rangle & h \end{array}$$

Mapping works great! Also, the 4th rule says that $B \rightarrow \epsilon$ should exist (which it does due to $X \rightarrow \epsilon$). So, I apply the rule as follows:

$[(\text{FIRST}(X) - \epsilon) \cup \text{FIRST}(Yh)] \in \text{FIRST}(S)$

I know already what is the $FIRST(X)$, but what about $FIRST(Yh)$? I do not have it yet and therefore, I need to calculate it. How do I calculate the $FIRST$ of two symbols? That's simple, just create a production that summarizes the two symbols into one as follows:

$temp \rightarrow Yh$

Therefore, if I find the $FIRST(temp)$, I have the $FIRST(Yh)$. Note that $temp$ is just a temporary symbol I created to aid with this operation and will discard immediately after.

I know that I cannot find the $FIRST(temp)$ using the 2nd rule because $temp$ derives a string that does not start with a terminal. So it's either the 3rd or 4th rule.

The 3rd rule maps quite well:

A	B	α
↑	↑	↑
temp	→ Y	h

However, it is not applicable since $Y \rightarrow \epsilon$. But the 4th rule which has the same mapping works and so I apply it:

$[(FIRST(Y) - \epsilon) \cup FIRST(h)] \in FIRST(temp)$

I have the $FIRST(Y)$. I also know that the $FIRST(h)$ is simply $\{h\}$ (see the 1st rule for the $FIRST$ set calculation). Therefore:

$FIRST(temp) = \{h, p\} = FIRST(Yh)$

Remember, I did all that work to arrive at the $FIRST(S)$. I had the following relationship:

$[(FIRST(X) - \epsilon) \cup FIRST(Yh)] \in FIRST(S)$

Since, I now know the $FIRST(X)$ and $FIRST(Yh)$, I can populate the $FIRST(S)$ set:

$FIRST(S) = \{h, p\}$

For the FOLLOW sets calculation:

$FOLLOW(S) = \{\$ \}$ (using the 1st rule).

To obtain the $FOLLOW(X)$, I need to analyze the following production (since it's the only one where X appears on the right-hand side):

$\langle S \rangle ::= \langle X \rangle \langle Y \rangle h$

The 2nd rule does not work since X does not appear at the end of the string XYh . However, the 3rd rules maps well as shown below:

The 3rd rule states that $\gamma \rightarrow \epsilon$ does not exist. However, γ refers to two symbols instead of one. Therefore, the only way $\gamma \rightarrow \epsilon$ would exist is if $Y \rightarrow \epsilon$ **and** $h \rightarrow \epsilon$. While Y does derive epsilon, h cannot derive anything other than itself, since it is a terminal. Therefore, you will never have a situation where $\gamma \rightarrow \epsilon$. I can safely conclude that $\gamma \rightarrow \epsilon$ does not exist. Hence, the 3rd rule is applicable as follows:

$\text{FIRST}(Yh) \in \text{FOLLOW}(X)$

We already have $\text{FIRST}(Yh)$. Therefore:

$\text{FOLLOW}(X) = \{h, p\}$

To obtain $\text{FOLLOW}(Y)$, I also simply apply the 3rd rule which yields:

$\text{FIRST}(h) \in \text{FOLLOW}(Y)$

This means that:

$\text{FOLLOW}(Y) = \{h\}$
